## APP COMPONENT:

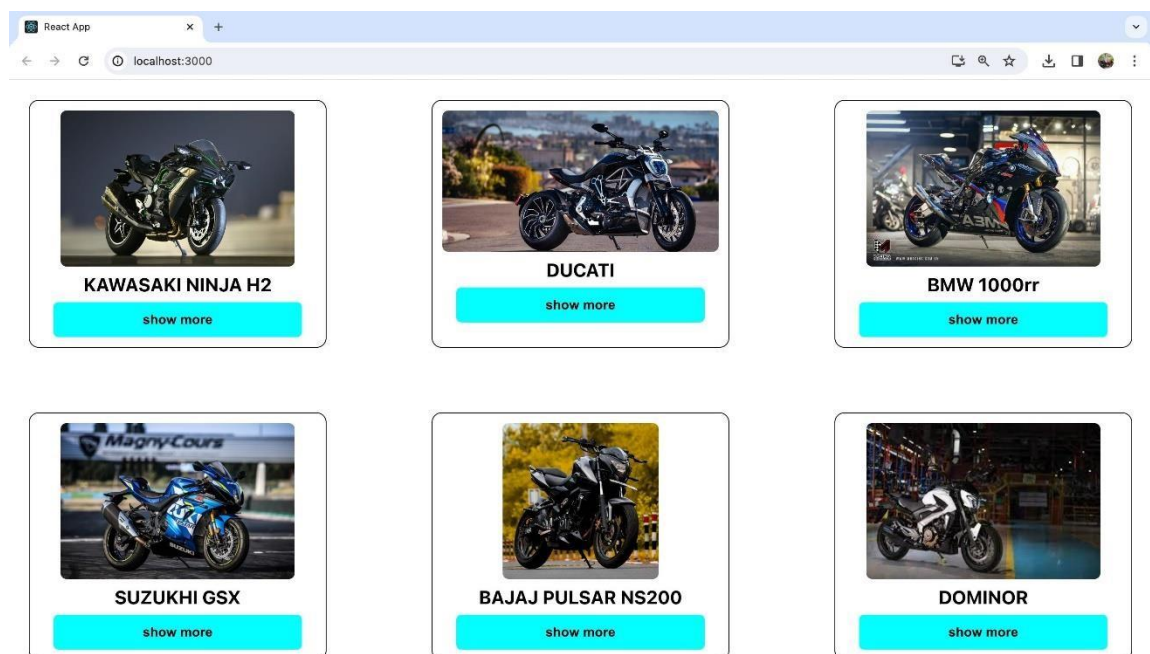

## APPROACH :

1. initially taking an array of objects like below

2. Passing this card array to child (card component) of App component by using props;
3. getting data as argument like {card} in card component.
4. in card component i use one state [show, setShow] to get extra info as description.
5. When we click the button then show becomes true by assigning setShow (!show) .

OUTPUT :

AFTER BUTTON CLICKS:
